

Carbon Pollution: A Game Changer for America's Hunting and Fishing Heritage

CLIMATE CHANGE

Carbon pollution from coal-burning power plants, refineries, and vehicles is causing worldwide climate change. America's wildlife is threatened by these assaults unknown until modern times. Fish are disappearing from lakes and streams, big game populations are being pushed out of their historic range, and duck wetland habitats are vanishing. From sea level to the highest mountain peaks, entire ecosystems are in retreat.

Changes from carbon pollution are leading to direct habitat loss as well as more insidious changes, such as decreases in snowpack that result in a massive loss of fish spawning sites and increased summertime temperatures that will change the wildlife communities of forests and streams forever. Many wildlife species are struggling to adapt. Some never will.

In a single generation, the future of fish and game is changing. Scientists predict that rising global temperatures could move 30% of all plant and wildlife species toward extinction in the lifetime of a child born today.¹ Taking action to reduce carbon pollution and confront our climate crisis will greatly benefit wildlife and our outdoor heritage.

America has a choice: Clean air, clean water, and healthy wildlife populations, or a polluted future where the only winners are special interests. This nation's core of conservationists, hunters, and anglers has a proud legacy of working to protect wildlife and must continue to do so as our world warms.

THE CLEAN AIR ACT WORKS

Passed by Congress with overwhelming bi-partisan support 40 years ago, the Clean Air Act has been one of the starting points for our country's proud legacy of environmental protection. This act has a strong and proven track record of protecting our lakes, forests, wildlife, national parks, and other natural treasures from the devastating impacts of air pollution while allowing our economy to prosper.

Modern threats of carbon pollution will change the game for American hunters and anglers. The Clean Air Act is a critical tool that we need available to significantly reduce this carbon pollution that is wreaking havoc on wildlife.

Now, the Environmental Protection Agency (EPA) plans to update the nation's pollution standards to address the wildlife impacts caused by the carbon pollution that leads to climate change. It is essential that EPA move forward on this important work to protect wildlife and our outdoor heritage from the worst effects of a climate change.

New Mexico: Wildlife Icons at Risk

Carbon pollution from coal-burning power plants is causing world-wide climate change. In New Mexico, climate change will include higher annual average temperatures, decreased water supplies, and decreased springtime snowpack which leads to reduced summer streamflows.² Changes in the earth's climate directly threaten two pastimes treasured in New Mexico and across our nation – recreational fishing and hunting.

In 2006, over 248,000 anglers and 99,000 hunters came to New Mexico to hunt and fish on its lands and waters. Fishing and hunting are not just recreational pastimes; they are also a major contributor to the New Mexico economy. These 347,000 sportsmen and women generated over \$465 million in revenue in that year alone.³ However, this rich community of fish and game, and the economy that depends on it, is at risk from a warming world.

Pronghorn

Native only to this continent, North America's fastest land animal is a worthy prize for any hunter in New Mexico. The most recognized threat to pronghorns is newly placed barriers such as roads and fences. However, we are now also seeing threats to pronghorn populations in the form of climate change impacts. Wildfires have destroyed habitats and migration ranges. Droughts and diminished water supplies are severely reducing the health of herds. Fueled by climate change, these impacts are on the rise and are a strong threat to this western game species' ability to maintain healthy populations.

Desert Bighorn Sheep

Desert bighorn sheep are facing new threats from climate change. Increased temperature and decreased precipitation are limiting the availability of the diverse plants that provide forage for the bighorn sheep by shifting the timing of the plants' peak production to earlier months of the year. When there isn't adequate food to ensure healthy seasonal reproduction, the populations of bighorn sheep are negatively affected. As climate change becomes more severe, it could mean significantly fewer prized bighorn sheep roaming the desert regions for sportsmen to hunt.

For American hunters, anglers, and conservationists healthy populations of wildlife are necessary to support our economy and outdoor heritage. It remains critical to speak up for New Mexico's iconic species and encourage the Environmental Protection Agency to update the nation's pollution standards.

The EPA must carry out its legal obligation to control carbon pollution that causes climate change from our country's biggest polluters and Congress must oppose all attempts to undermine Clean Air Act programs.
